## The Next Breast Thing

**W**omen who have saline breast implants may find that when they lie down or change position, the fluid inside appears to flatten or slosh. The Ideal Implant, in contrast, consists of several shells that decrease in size like Russian nesting dolls, with saline in the inner and outer ones—yielding a more stable shape and a more natural feel, akin to that

of silicone gel. For women who don't want silicone because of the 2.7 percent risk of undetectable leaks and the need for annual monitoring with an MRI, saline provides "peace of mind," says the new implant's developer, Robert S. Hamas, a plastic surgeon in Dallas. A proposed FDA trial is recruiting patients (information is at [idealimplant.com](http://idealimplant.com)), and Hamas says the product could be available by 2010.
